# Summary

**System: Time Warner: CLEVELAND HEIGHTS, OH**

**Test Date: September 11, 2007**

A fly-over test for the system was performed to evaluate the system on the basis of signal leakage in the aeronautical band (108-140 MHz) as required by the F.C.C. (frequencies outside range will receive correction factor, see *Procedure* step 2a), and to determine the location and levels of any non-complying leaks (leaks in excess of 10 uV/m at 1500 feet). A description of the procedure, probability graph, a list of relative high readings, and a plotted map showing the system boundary, flight pattern and locations of relative high readings are included. Listed below are the results.

1. Generator level input into calibration antenna	<b>6.55</b> millivolts
2. Receiver adjustment to force a 10 uV/m reading	<b>0</b> dB
3. Measure signal level of peak video carrier in aeronautical band at test point, and set generator level one dB higher.	
4. Number of sample points	<b>22,758</b> points
5. Number of points > 10 uV/m	<b>58</b> points
6. Minimum leakage	<b>0.84</b> uV/m
7. Maximum leakage	<b>10.49</b> uV/m
8. Average field intensity	<b>1.5</b> uV/m
9. Percentage of points < 10 uV/m	<b>99.74</b> %

**F.C.C. requirements status: PASSED**

# Procedure

1. Determine system boundaries and correlate to Topo map using either a 7.5' or a 1:100,000 scale print.
2. Determine proper channel and time for testing, using a modulated carrier between 108 and 140 MHz.

**Date:** September 11, 2007

**Time:** 12:05 AM

**Frequency:** 133.2625 MHz

2a. Apply Correction factor:

**Frequencies above 140:** (Data Sample) + 20 \* log( f/140 )

**Frequencies below 108:** (Data Sample) + 20 \* log( f/108 )

### 3. Calibration of Receiver

Establish signal generator input levels which will be used to calibrate AOR receiver. If calibration graph is not provided with the report, the calibration was performed at 3 feet above the ground. If calibration graph is provided with the report, the calibration was performed at 1,500 feet above ground level.

10 uV/m field (at 3 or 1,500 feet & 133.2625 MHz)

#### Convert uV/m to dBmV:

$$\begin{aligned} \text{dBmV} &= 20 * \log( E ) - 20 * \log( 20.7 * f ) \\ &\quad (\text{where } E = 10 \text{ uV/m and } f = \text{frequency in MHz}) \\ &= 20 - 20 * \log( 20.7 * 133.2625 ) \\ &= -48.8136 \text{ dBmV} \end{aligned}$$

$$\begin{aligned} \text{dBuV} &= -48.8136 + 60 \text{ ( dBuV = dBmV + 60 )} \\ &\quad (\text{we increase this amount by a factor of 20 dB to increase our sensitivity}) \\ \text{dB} &= 20 * \log( x/10 ) \text{ where } x=100 \text{ uV/m or expected reading in receiver is } 100 \text{ uV/m} \end{aligned}$$

$$\text{dBuV} = 11.1864 + 20 \text{ dB}$$

#### Determine Free Space Loss:

$$\begin{aligned} \text{FSL} &= -37.87 + 20 * \log( f ) + 20 * \log( d ) \\ f &= \text{frequency in MHz and } d = \text{distance feet} \\ &= -37.87 + 20 * \log( 133.2625 ) + 9.54 \\ &= 14.1642 \text{ dB} \end{aligned}$$

#### Determine Signal Level Input:

$$\begin{aligned} 100 \text{ uV/m} &= (\text{free space and cable loss}) \\ &\quad - (\text{dipole and reflector gain}) \\ &\quad - (\text{impedance mismatch: } 50 \text{ ohm to } 75 \text{ ohm}) \\ &\quad + (22 \text{ dB gain amp + input}) \end{aligned}$$

**Cable and Filter Loss (from antenna to receiver) = 4 dB**

$$\begin{aligned} \text{Dipole gain} &= 0 \text{ dB at } 133.2625 \text{ MHz} \\ &\quad (\text{reflector gain} = 2 \text{ dB; impedance gain} = 1 \text{ dB}) \end{aligned}$$

$$\begin{aligned} \text{Free space loss} &= 14.1642 \text{ dB} \\ \text{dBuV} &= 22 \text{ dB} - 4 \text{ dB} - 14.1642 + 3 \text{ dB} + X \text{ (where } X = \text{generator input)} \\ 31.1864 &= ( 21 - 14.1642 ) + X \end{aligned}$$

$$X = 31.1864 - ( 21 - 14.1642 )$$

$$X = 24.3506 - 108.75 \text{ (the signal generator level to create an } 100 \text{ uV/m leak at receiver)}$$

$$X = -84.3994 \text{ dBm ( dBm = dBuV - 108.75 )}$$

#### Convert to millivolts:

$$\begin{aligned} \text{mV} &= 10 ( \text{dBuV}/20 ) \\ &= 32.9253 \text{ uV} \end{aligned}$$

# Procedure

4. Test signal level input of generator with signal level meter to insure accuracy.
5. **If using video carrier:**  
Flyover performed using channel C video carrier.  
**If using modulated carrier:**  
Insert generator to combining network at 133.2625 MHz.  
Measure signal level of channel C video carrier at headend trunk output test point with signal level meter.  
Set generator output one dB above measured channel C video carrier level.
6. Perform system fly-over at 1500 feet in a grid pattern (all plant covered within 1/2 mile of pattern) at 120mph, combining GPS and signal level readings simultaneously with our software into an on-board computer (see *Test Configuration*).
7. Using system boundary polygon, filter all data points outside of system using custom software.
8. Develop a frequency distribution graph (see Probability Graph ) and a listing of all relative high readings.
9. Plot all leak levels on digitized map showing the exact locations of all relative high readings along with the flight pattern .
10. An Enhanced test is a test performed with a test level inserted 2 dB or higher than adjacent video carrier levels. To generate the FCC standard report, all test data is reduced utilizing the following formula:  
$$\text{dB} = 20 * \log( x / 10 ).$$
